

BIRD NESTS

ARE A NUISANCE

Birds Pose Health Hazards and Liabilities

Birds nest on roofs: in vents, chimneys, gutters, soffits, etc.

Nests cause damage related to where they are. For example, nesting in a gutter: water won't drain.

Birds carry over 60 known transmittable diseases. Anyone can contract disease through physical contamination or inhalation.

Bird droppings can pile up and lead to slip and fall claims.

It damages vehicles and other property because it can burn through metal causing rust and holes.

Use Bird Deterrents on Roofs

Nests with eggs are protected by law so you cannot remove them.

The only way to protect roofs from birds is with deterrents. There are several types including netting, bird spikes, bird spiders and bird shock electrical tracks, which condition birds to stay away from the buildings by giving a mild shock when they land.

Prevent unwanted birds and the damage they cause by installing humane deterrents before nesting season starts.

Design Roofing makes custom bird deterrents to fit perfectly on any roof without having to wait on a supplier.
